# DATA SOURCES FOR FICK EQUATION

## FICK EQUATION

$$CL = Q \left[ \frac{A - V}{A} \right]$$

$$E = \left[ \frac{A - V}{A} \right]$$

- Q = DIALYZER BLOOD FLOW
- A = CONCENTRATION IN BLOOD COMING TO DIALYZER
- V = CONCENTRATION IN BLOOD LEAVING DIALYZER
- **E = EXTRACTION RATIO**

## **EXTRACTION RATIO**

Renkin Equation:

$$\mathbf{E} = \left[ \mathbf{1} - \mathbf{e}^{-P/Q} \right]$$

Fick Equation:

$$\mathbf{E} = \left\lceil \frac{\mathbf{A} - \mathbf{V}}{\mathbf{A}} \right\rceil$$

In Each Case:

# CALCULATION OF RECOVERY CLEARANCE THE GOLD STANDARD

$$CL = \frac{U \cdot V}{P \cdot t}$$

U = DIALYSATE CONCENTRATION

V = DIALYSATE VOLUME

t = DIALYSIS TIME

P = MEAN PLASMA CONCENTRATION

## TWO DIALYSIS MYTHS

\* NEED TO USE BLOOD CONCENTRATIONS WHEN CALCULATING BLOOD CLEARANCE

BUT PLASMA CONCENTRATIONS
PROPORTIONAL TO BLOOD
CONCENTRATIONS, SO MAKES NO
DIFFERENCE IN A/[A + V] RATIO

\* NEED TO USE PLASMA FLOW WHEN CALCULATING PLASMA CLEARANCE

#### PLASMA VS. BLOOD CLEARANCE

$$RECOVERY : CL_P = \frac{U \bullet V}{P}$$

$$CL_B = \frac{U \bullet V}{B}$$

$$CL_P = Q_{PK} \left( \frac{A-V}{A} \right)$$

$$CL_B = Q_B \left( \frac{A-V}{A} \right)$$

$$\label{eq:local_problem} \text{IF B} > \text{P: CL}_{\text{\tiny p}} > \text{CL}_{\text{\tiny g}}, \ \text{SO: } \ \text{Q}_{\text{\tiny pK}} > \text{Q}_{\text{\tiny p}} > \text{Q}_{\text{\tiny p}}$$

## NAPA IN RBC IS DIALYZED

FLOW PARAMETER	MEAN VALUE mL/min	
$\mathbf{Q}_{\mathrm{PK}}$	223	
Q <sub>MEAS</sub>	195 (p < 0.2)	
Q <sub>EFF</sub> *	217 (p > 0.2)	

\*  $Q_{EFF} = [(1 - Hct) + (RBC/P) (HCT)] Q_{MEAS}$ 

## GOALS OF DIALYSIS DISCUSSION

# EFFECT OF ARGININE VASOPRESSIN (AVP) ON P• S\*

### CLINICAL CONSEQUENCES OF DIALYSIS-ASSOCIATED HEMODYNAMIC CHANGES

- \* IMPACT ON HEMODIALYSIS THERAPY OF DRUG TOXICITY
- \* PATHOGENEIC ROLE IN DIALYSIS-ASSOCIATED SKELETAL MUSCLE CRAMPS

### DIALYSIS CASE HISTORY

A 67 year-old woman became lethargic and confused and developed hypotension, renal insufficiency, junctional tachycardia and intraventricular conduction delay after ingesting an estimated 7gm of procainamide (PA). Plasma PA and NAPA concentrations were 57  $\mu$ g/mL and 55  $\mu$ g/mL, respectively.

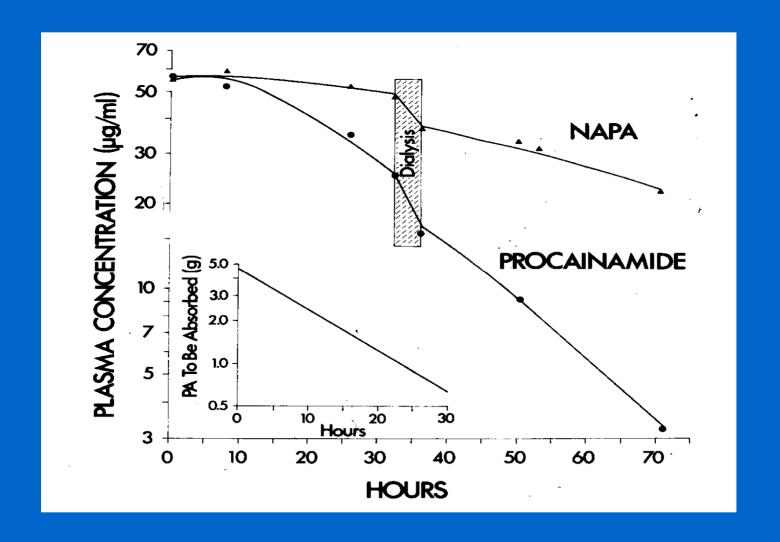

### DIALYSIS CASE HISTORY (cont.)

Hemodialysis was performed for 4 hr. By the end of the second hour BP was maintained in the range of 110/80 mm Hg without vasopressor therapy. At the end of dialysis, the patient was alert and oriented although only 340 mg of PA and 470 mg of NAPA had been removed by this procedure.

### DIALYSIS CASE HISTORY (cont.)

Fifteen hours after dialysis, PA and NAPA levels were 9.2  $\mu$ g/mL and 33  $\mu$ g/mL, respectively. The patient had returned to normal sinus rhythm with QRS = 0.12 sec.

### KINETIC ANALYSIS OF HEMODIALYSIS FOR PROCAINAMIDE TOXICITY\*

<sup>\*</sup> From: Atkinson AJ Jr, et al. Clin Pharmacol Ther 1976;20:585-92.

### CRITERION FOR DIALYSIS EFFICACY\*

$$CL_{EC} > 30\% [CL_R + CL_{NR}]$$

\* Levy G. Am J Med 1977;62:461-5.

### WAS DIALYSIS EFFICACIOUS?

\* DIALYSIS INCREASED DRUG CLEARANCE

PA - TWO FOLD

NAPA - 3.8 FOLD

\* BUT 4 hr OF DIALYSIS REMOVED < 1 gm of 7 gm DOSE

340 mg PA

470 mg NAPA

\* HOWEVER, BLOOD LEVELS FELL SUBSTANTIALLY

PA: 25.7 μg/mL 15.5 μg/mL

NAPA: 47.0 μg/mL 35.5 μg/mL

**AND PATIENT'S CONDITION STABILIZED** 

# PA & NAPA KINETICS IN TOXIC PATIENT

	NORMAL		PATIENT	
	PA	NAPA	PA	NAPA
t <sub>1/2</sub> (hr)	2.5	6.2	10.5	35.9
V <sub>dβ</sub> (L/kg)	1.80	1.76	0.76	0.63
CL <sub>E</sub> (mL/min)	590	233	66.8	16.1
CL <sub>D</sub> (mL/min)			68.3	45.8

## ESTIMATION OF V<sub>d</sub>

Question: Why was distribution volume estimate so much lower in patient than in normal subjects?

USUAL  $V_d$  ESTIMATE:  $V_d = \frac{DOSE GIVEN}{\Delta CONCENTRATION}$  DIALYSIS  $V_d$  ESTIMATE:  $V_d = \frac{DRUG REMOVED}{\Delta CONCENTRATION}$ 

## SEQUESTRATION OF DRUG IN SOMATIC TISSUES

## EFFICACY OF EXTRACORPOREAL TREATMENT OF DRUG TOXICITY

- \* TOTAL EXTENT OF DRUG REMOVAL MAY BE COMPROMIZED BY \( \text{CL}\_S. \)
- \* CL<sub>S</sub> FROM SOMATIC TISSUES CAN
  ACCELERATE | IN DRUG CONCENTRATION
  TO WHICH VITAL ORGANS (CNS, HEART) ARE
  EXPOSED AND RESULT IN A BENEFICIAL
  CLINICAL RESPONSE > EXTENT OF DRUG
  REMOVAL.
- \* 

  CL<sub>S</sub> FROM SOMATIC TISSUES ALSO

  ATTENUATES POST-DIALYSIS REBOUND.

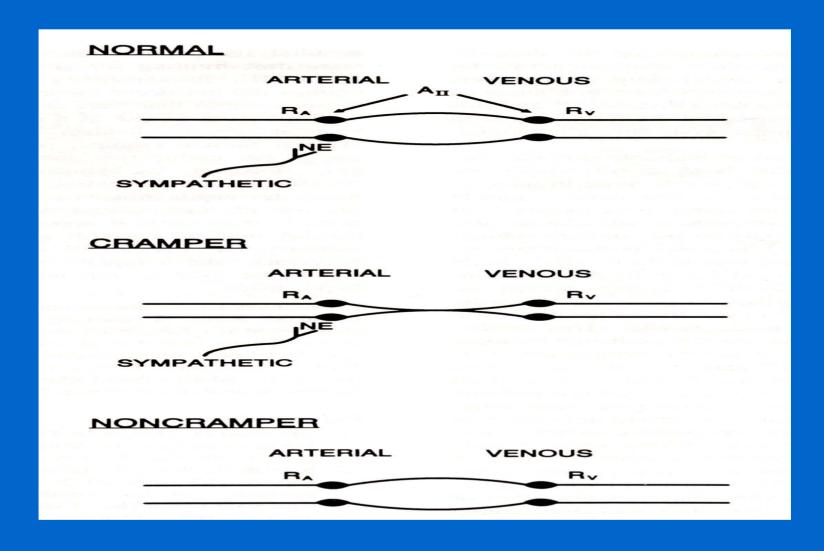

### CLINICAL CONSEQUENCES OF DIALYSIS-ASSOCIATED HEMODYNAMIC CHANGES

- \* IMPACT ON HEMODIALYSIS THERAPY OF DRUG TOXICITY
- \* PATHOGENEIC ROLE IN DIALYSIS-ASSOCIATED SKELETAL MUSCLE CRAMPS

## ACTIONS OF ANGIOTENSIN II & SYMPATHETIC NERVOUS SYSTEM

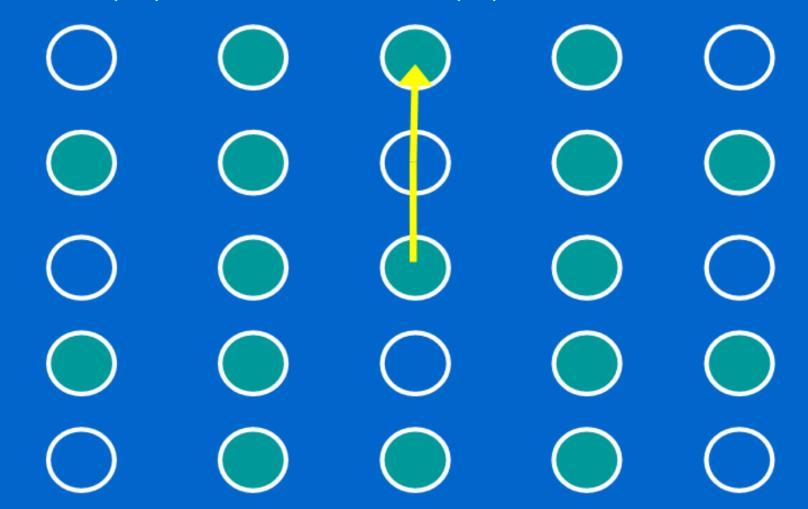

#### ONLY SOME PATIENTS HAVE DIALYSIS-ASSOCIATED SKELETAL MUSCLE CRAMPS\*

\* Sidhom OA, et al. Clin Pharmacol Ther 1994;56:445-51

# CAPILLARY DERECRUITMENT (OPEN (O) & CLOSED (•) CAPILLARIES)

**OPEN CAPILLARIES IN MUSCLE CROSS SECTION** 

### PATHOGENESIS OF DIALYSIS-ASSOCIATED SKELETAL MUSCLE CRAMPS

HEMODIALYSIS X — NaCl, MANNITOL PLASMA VOLUME CONTRACTION ACE INHIBITOR → +X ← PRAZOSIN UNMODULATED SYMPATHETIC ACTIVATION PERIPHERAL VASOCONSTRICTION DERECRUITMENT OF MUSCLE CAPILLARIES **IMPAIRED MUSCLE OXYGENATION** SKELETAL MUSCLE CRAMPS

### **CONCLUDING THOUGHT**

ALTHOUGH NON-COMPARTMENTAL ANALYSIS OF PK DATA IS CURRENTLY IN VOGUE, IT IS UNABLE TO PROVIDE INSIGHT INTO SOME IMPORTANT PHENOMENA:

- IMPACT OF ↓ SPLANCHNIC BLOOD FLOW (↓ CL<sub>F</sub>) ON BIOAVAILABILITY
- IMPACT OF DIALYSIS-ASSOCIATED HEMODYNAMIC CHANGES (↓ CL<sub>s</sub>)
